BY KATHARINE SCHWAB 5 MINUTE READ

For Mauro Porcini, design is the key to making a corporation like PepsiCo relevant. He [joined](#) the company in 2012 after a 10-year stint as Chief Design Officer at 3M, and has focused his efforts on creating a company culture that embraces design thinking to make the food and beverage giant more nimble, and create experiences that grow the brand.

At the 2016 Fast Company Innovation Festival, Porcini cited five books that have shaped his design philosophy and helped him implement it in

“Design is the key  
to making a  
corporation like  
PepsiCo relevant.”

## UBER: DESIGNING TRUST INTO A COMPANY THAT DESPERATELY NEEDS IT

With a new CEO at the helm, changes to its executive board, and a renewed focus on profitability, Uber is trying to right its ship after a tumultuous 2017. The role of design in that transition, according to vice president of design Michael Gough, is to introduce a more empathic and considered approach to the company and the product. The rapid expansion model that helped Uber scale is no longer sufficient for a company that on the surface may be running an app but in the process is creating new economies. “If we got a button wrong at Adobe, people complained,” shares Gough, who prior to Uber led design teams at Microsoft and Adobe. “If we get a button wrong at Uber, entire economies get disrupted. You have to think about all these repercussions, because little mistakes can have incredible downstream

BY AILEEN KWUN 8 MINUTE READ

Last week, Christopher Hawthorne—the *Los Angeles Times*’s architecture critic of 14 years—announced he’d be [leaving his post to become L.A.’s first-ever chief design officer](#). The new role, specially created for him by Los Angeles Mayor Eric Garcetti, signaled that design criticism now had a seat at the City Hall table.

Posting the [announcement on Twitter](#), Hawthorne (who’s swiftly updated his handle from [@HawthorneLAT](#) to [@HawthorneCDOLA](#)) humbly admitted that being an architecture critic at a major U.S. newspaper is the only role he’d previously aspired to fulfill, and yet in [his final column for the \*Times\*](#), made it clear there’s no shortage of issues for him to tackle in his new job—from climate change to

“Design criticism now had a seat at the City Hall table.”

This subcommittee is suitable for papers that make a significant designerly contribution to HCI. Papers submitted here develop and probe at various concerns, shaping design practice.

Contributions include detailed descriptions of and reflections on design processes, interactive products, services, and systems that advance the state of the art; explorations and insights gleaned from working with interactive design materials; suggestions and provocations exploring new design tools, processes, methods, or principles, including those that explore alternatives to scientific ways of knowing; work that applies perspectives from other disciplines to inspire or to critique the design of interactive things; or work that advances knowledge on the human activity of design as it relates to HCI research or practice.

We particularly encourage contributions of new work that engages and builds upon the legacies of design in HCI to broaden the boundaries of interaction design and promote new aesthetic and sociocultural possibilities.

“

I identified five aspects of designerly ways of Knowing:

- Designers tackle 'ill-defined' problems.
- Their mode of problem-solving is 'solution-focused'.
- Their mode of thinking is 'constructive'.
- They use 'codes' that translate abstract requirements into concrete objects.
- They use these codes to both 'read' and 'write' in 'object languages'.

*Conversely, HCI has always also belonged, at least in part, to other disciplines. Concurrent early HCI programs developed in ergonomics and psychology; it is not uncommon to find faculty with research interests in HCI in architecture, art and design, cognitive science, communications, education, English, geography, industrial engineering, information systems, library science, psychology, sociology, and now, of course, i-schools.*

(Carroll et al., 2006)

# Subcommittee history at CHI

*What is this subcommittee's history at CHI?*

- *How long has this area been its own a subcommittee?*
- *Was this work represented by a different subcommittee at CHI prior to becoming a dedicated subcommittee?*
- *How, if at all, has the subcommittee's description of what makes a contribution changed over time?*

Design is a facet  
of CHI.

As design has  
evolved, so has  
CHI.

## DESIGN PRINCIPLES FOR HUMAN-COMPUTER INTERFACES

Donald A. Norman  
Department of Psychology  
and  
Institute for Cognitive Science C-015  
University of California, San Diego  
La Jolla, California 92093

### ABSTRACT

If the field of Human Factors in Computer Systems is to be a success it must develop design principles that are useful, principles that apply across a wide range of technologies. In the first part of this paper I discuss some the properties that useful principles should have. While I am at it, I warn of the dangers of the tar pits and the sirens of technology. We cannot avoid these dangers entirely, for were we to do so, we would fail to cope with the real problems and hazards of the field.

The second part of the paper is intended to illustrate the first part through the example of tradeoff analysis. Any single design technique is apt to have its virtues along one dimension compensated by deficiencies along another. Tradeoff analysis provides a quantitative method of assessing tradeoff relations for two attributes  $x_i$  and  $x_j$  by first determining the *User Satisfaction* function for each,  $U(x)$ , then showing how  $U(x_i)$  trades off against  $U(x_j)$ . In general, the *User Satisfaction* for a system is given by the weighted sum of the *User Satisfaction* values for the attributes. The analysis is used to examine two different tradeoffs of information versus time and editor workspace versus menu size. Tradeoffs involving command languages versus menu-based systems, choices of names, and handheld computers versus workstations are examined briefly.

If we intend a science of human-computer interaction, it is essential that we have principles from which to derive the manner of the interaction between person and computer. It is easy to devise experiments to test this idea or that, to compare and contrast alternatives, or to evaluate the quality of the latest technological offering. But we must aspire to more than responsiveness to the current need. The technology upon which the human-computer interface is built changes rapidly relative to the time with which psychological experimentation yields answers. If we do not take care, today's answers apply only to yesterday's concerns.

"Consider the user" are valid, but worthless. We need more precise principles.

This new field — Human Factors in Computer Systems — contains an unruly mixture of theoretical issues and practical problems. Just as it is important that our theoretical concerns have breadth, generality, and usability, so too is it important that we understand the practical problems. We are blessed with an exciting, rapidly developing technology that is controlled through the time consuming and addictive procedure called programming. There are traps for the unwary: let me tell you about them.

**Design is a facet  
of CHI.**

**As design has  
evolved, so has  
CHI.**

# *Research through design as a method for interaction design research in HCI*

John Zimmerman, Jodi Forlizzi, Shelley Evenson  
2007

# What is *Research through Design*?

Check out the chapter from *Ways of Knowing in HCI* by Olson and Kellogg.

“RtD frames **design inquiry as a distinctly separate activity** from engineering inquiry and scientific inquiry.”

“Research *through design* differs in that it is an **approach to doing research**. It can **result in knowledge *for design and into design***.”

# How do we apply this to Interaction Design?

This is where the framing paper comes in.

“designers produce **novel integrations** of HCI research in an attempt **to make the *right thing***: a product that transforms the world from its current state to a preferred state.”

Not only do we have a model now, we also have “**a set of criteria for evaluating** the quality of an interaction design research contribution.”

# What is *Research through Design*?

Check out the chapter from *Ways of Knowing* by Olson and Kellogg.

“RtD frames **design inquiry as distinctly separate activity** from engineering inquiry and scientific inquiry.”

“Research *through design* differs from traditional research in that it is an **approach to doing research** that **result in knowledge for design design.**”

Drawing from “Research contributions in human-computer interaction,” this is a **methodological contribution.**

# How do we apply this to Interaction Design?

framing paper comes in.

produce **novel integrations** of knowledge in an attempt **to make the** design a product that transforms the current state to a preferred state.

Now we have a model now, we also have **criteria for evaluating** the quality of an interaction design research contribution.”

# Paper overview

*Research through design as a method for interaction design research in HCI*

What is the relationship between interaction design and the HCI community?  
How can research through design be an important tool for interface designers?

# Paper overview

*Research through design as a method for interaction design research in HCI*

## What is the relationship between interaction design and the HCI community?

### **HCI researchers on design and design research**

While interaction designers could articulate their role within an HCI team, researchers were far less articulate about the role of interaction design. In our interviews with leading HCI researchers, we heard views of design as “the discovery of mental models”, “a discipline focused on the whole instead of the parts”, and “desire to understand users”. However, the dominant view was that **designers focused solely on the surface structure, or the visual aesthetics of software and hardware artifacts**. This idea of design and designers as having a focus on decoration is a commonly held belief of design by most people [5].

# Paper overview

*Research through design as a method for interaction design research in HCI*

**How can *research through design* be an important tool for interface designers?**

- Is it reproducible? (***process***)
- Does it make an advancement from the current state of the world? (***invention***)
- Is it relevant? (***relevance***)
- Can you build upon the work you have created? (***extensibility***)

“Through an active process of ideating, iterating, and critiquing potential solutions, design researchers continually reframe the problem as they attempt to make the *right* thing.”

**Figure 1. An illustration of the pathways and deliverables between and among Interaction Design Researchers and other HCI Researchers. The model emphasizes the production of artifacts as vehicles for embodying what “ought to be” and that influence both the research and practice communities.**

# *Wicked problems in design thinking*

Richard Buchanan  
1992

Richard Buchanan is a professor of design, management, and information systems.

Currently he teaches at the Weatherhead School of Management at Case Western Reserve University.

Previously he was the head of the Carnegie Mellon School of Design. He serves as an editor of Design Issues and is a past President of the Design Research Society.

# Three major contributions in this paper:

1. Positioning of design as a discipline
2. Definition of the four placements
3. Description of Wicked Problems

“

*This follows the trend of design thinking in the twentieth century, for we have seen design grow from a trade activity to a segmented profession to a field for technical research and to what now should be recognized as a new liberal art of technological culture.*

“

*This follows the trend of design thinking in the twentieth century, for we have seen design grow from a trade activity to a segmented profession to a field for technical research and to what now should be recognized as a new liberal art of technological culture.*

*Richard Buchanan, p5*

**What is a *liberal art*?**

**What is *technological culture*?**

**What does *new liberal art of technological culture* mean?**

“

*This follows the trend of design thinking in the twentieth century, for we have seen design grow from a trade activity to a segmented profession to a field for technical research and to what now should be recognized as a new liberal art of technological culture.*

*Richard Buchanan, p5*

What is a *liberal art*?

What is *technological culture*?

What does *new liberal art of technological culture* mean?

“By ‘liberal art’ I mean a discipline of thinking that may be shared to some degree by all men and women in their daily lives and is, in turn, mastered by a few people who practice the discipline with distinctive insight and sometimes advance it to new areas of innovative application.”

*p8*

# Positioning of design as its own discipline

*Design is not science;* designers make things that did not exist before.

*Design is not art;* design as a verb is a form of both problem solving and creative thinking, and design as a noun indicates objects that are presented into the world for use.

# Positioning of design as its own discipline

*Design is not science;* designers make things that did not exist before.

*Design is not art;* design as a verb is a form of both problem solving and creative thinking, and design as a noun indicates objects that are presented into the world for use.

Design is...

- A way of solving problems
- A way of making sense of and humanizing technology
- A way of manipulating the world through artifacts
- An amplifier of ideas and messages
- The material of culture

... what else?

# The doctrine of the four placements

Symbolic and visual  
communication

Material objects

Activities and organized  
services

Complex systems or  
environments for living,  
working, playing, and  
learning

# The doctrine of the four placements

Symbolic and visual  
communication

Material objects

Activities and organized  
services

Complex systems or  
environments for living,  
working, playing, and  
learning

“There are so many examples of conceptual repositioning in design that it is surprising no one has recognized the systematic pattern of invention that lies behind design thinking in the twentieth century. The pattern is found not in a set of categories but in a rich, diverse, and changing set of placements, such as those identified by signs, things, actions, and thoughts.”

*p12*

“In fact, signs, things, actions, and thoughts are not only interconnected, they also interpenetrate and merge in contemporary design thinking with surprising consequences for innovation.”

*p10*

“

*...the wicked-problems approach suggests that there is a fundamental indeterminacy in all but the most trivial design problems—problems where, as Rittel suggests, the ‘wickedness’ has already been taken out to yield determinate or analytic problems...*

“

*...the wicked-problems approach suggests that there is a fundamental indeterminacy in all but the most trivial design problems—problems where, as Rittel suggests, the ‘wickedness’ has already been taken out to yield determinate or analytic problems...*

1. Wicked problems have no definitive formulation, but every formulation of a wicked problem corresponds to the formulation of a solution.
2. Wicked problems have no stopping rules.
3. Solutions to wicked problems cannot be true or false, only good or bad.
4. In solving wicked problems there is no exhaustive list of admissible operations.
5. For every wicked problem there is always more than one possible explanation, with explanations depending on the Weltanschauung of the designer.
6. Every wicked problem is a symptom of another, "higher level," problem.
7. No formulation and solution of a wicked problem has a definitive test.
8. Solving a wicked problem is a "one shot" operation, with no room for trial and error.
9. Every wicked problem is unique.
10. The wicked problem solver has no right to be wrong—they are fully responsible for their actions.

# Design in the context of wicked problems

Design has no subject matter of its own.

In the process of solving a design problem, a designer generates new knowledge, of the problem itself.

Back to placements...

**“In this sense, the placements selected by a designer are the same as what determinate subject matters are for the scientist. They are the quasi-subject matter of design thinking, from which the designer fashions a working hypothesis suited to special circumstance.”**

*p17*

# Major takeaways from *Wicked problems in design thinking*:

## 1. Design is its own discipline.

Design has its own methods, processes, ways of working, and contributions. It is not science and does not conform to a scientific, positivist framing—and shouldn't be judged through that lens.

## 2. Designers work within four placements.

Placements represent the substance of the work, or the space where innovation occurs. They blend and change and intersect during the process of working through a design problem.

## 3. Design problems have qualities that make them indeterminate, and so they are framed in the context of solving them, and they have no objective, correct solution.

# What do the framing papers suggest are core sub-topics within the subcommittee?

*Research through design as a method for interaction design research in HCI*

John Zimmerman, Jodi Forlizzi, Shelley Evenson  
2007

- The design and observation of artifacts in, and across, the four placements.
- Engagement with people, on the way towards designing artifacts
- ...

*Wicked problems in design thinking*

Richard Buchanan  
1992

# What do the framing papers suggest are typical methodological approaches to doing research?

*Research through design as a method for interaction design research in HCI*

John Zimmerman, Jodi Forlizzi, Shelley Evenson  
2007

- Conducting qualitative research with people to understand how they live, work, and experience the things around them.
- Making things, in order to understand how things are made.
- Evaluating things, in order to understand how they work.
- ...

*Wicked problems in design thinking*

Richard Buchanan  
1992

# What do the framing papers suggest are theoretical perspectives of that subcommittee for doing research?

*Research through design as a method for interaction design research in HCI*

John Zimmerman, Jodi Forlizzi, Shelley Evenson  
2007

*Wicked problems in design thinking*

Richard Buchanan  
1992

## **Design:**

- Examining the role of design as compared to science, art, and other disciplines.
- Considering the way designers do their work, and how it is the same as or different than how other disciplines do their work.
- Exploring where design knowledge comes from.

## **People & Design (HCI):**

- What are the complex systems and environments we as humans encounter in our everyday lives?
- ...

# Summary

## What is Design?

Design as a practice is constructed by many disciplines and definitions. One of them is **a way of solving problems**.

## What do the framing papers suggest?

Design requires action and observation, and there are many ways to achieve this: qualitative studies, building things, etc.

## What does CHI's Design subcommittee look like?

CHI's design subcommittee has **evolved and matured** with the field of design, asking authors to contribute novel ideas.

## What do the framing papers make us think about?

Our intention when and how we design.

# Design Discussion

# Inside Amazon’s ‘Iliad Flow,’ the deceptive UX at the center of its federal trial

We unpack the FTC’s claims that Amazon used design to trick customers into buying—and keeping—a Prime subscription.

BY GRACE SNELLING

LISTEN TO THIS ARTICLE

▶

0 : 00 / 7 : 11

[More info](#)

If the FTC wins this current case, Carroll says, it may send a message to smaller companies that there’s legitimacy to the consumer protection argument around dark patterns. It could even show that what Carroll describes as “internal discussions being diabolical about designing dark patterns” are, quite simply, bad for business.

# What of the typical HCI research contributions is this paper making? Why was this contribution appropriate for the paper?

## Components of the Temporal Analysis of Dark Patterns

**Characteristics of the interface.**

**Relationships between dark patterns and UI elements.**

**Combinations of dark patterns over time.**

What are the main takeaways of this paper for the HCI research community? What, if any, are the main takeaways of this paper to other research communities?

S

**Dark patterns are important to study, and exhibit specific qualities.**

**Policymakers and legislators must consider dark patterns.**

**Studying dark patterns involves a specific framework.**

# *Strategic Design: The integration of the two fields of Strategy and Design*

Jan Michel Auernhammer, Stanford  
2024

# Background: the players mentioned

# Design in Strategy

Classical design school

Strategy as organizational learning

Open strategy and strategy without design

**What did each of these approaches emphasize?**

# Strategy in Design

Social and comprehensive design

Design methodology

Reflective and social practices

**What did each of these approaches emphasize?**

# The basic framework

| Strategic design as | Strategy                                       | Design                                    |
|---------------------|------------------------------------------------|-------------------------------------------|
| Planning practice   | Rationalistic planning (e.g., strategic tools) | Design methodology (e.g., design methods) |
| Learning practice   | Organizational learning                        | Reflective practice                       |
| Social practice     | Strategy without “design”                      | Comprehensive design                      |

**What is the takeaway from the framework?**

# The comprehensive (?) framework

# How does this paper argue that its topic is worthy of study?

**What language is used in the introduction to substantiate the topic?**

# What areas of inquiry within HCI and outside of HCI does the paper draw from? How does the paper expand on those areas to make its contribution?

This paper is from the Design Research Society.

**What areas of study does it draw from? Why is that important?**

# What are the typical HCI research contributions is this paper making? Why was this contribution appropriate for the paper?

**What is the major contribution of this paper?**

**If this paper were published in CHI, how would it be viewed? Why?**

# What are the main takeaways of this paper for the HCI research community? What, if any, are the main takeaways of this paper to other research communities?

If you were a design researcher, what would you take from this paper?

If you were an HCI researcher, what would you take from this paper?

If you were a practitioner, what would you take from this paper?

# If there's time...
